

Virtual Research Rotation

with Harvard Medical School Plastic Surgery

Residency Program Director

A research-focused rotation with one of the top research institutions in the U.S.

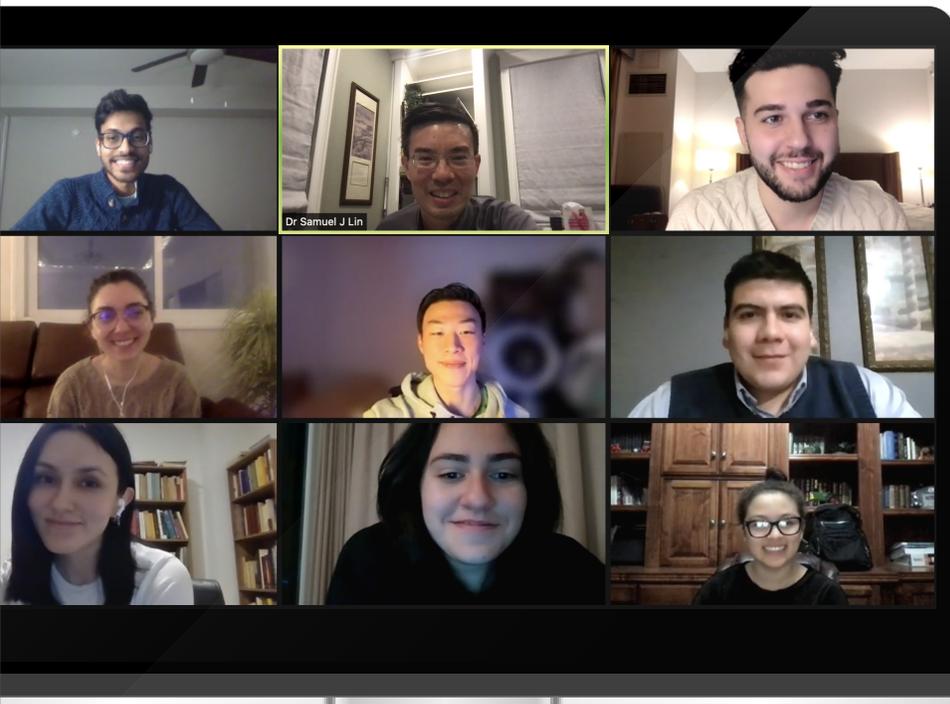

Training the Next Generation of Medical Researchers

Trainees are exposed to medical research settings and are empowered to conduct research in their chosen specialty.

The rotation builds a foundation of best research practices by navigating trainees through each stage of the research process. It begins with trainees designing a research project before moving on to gathering data, analyzing results, and submitting research for publication or presentation.

Opportunities for Authorship

The research publishes 20-30 articles per year. This provides students with the opportunity to join as coauthors of ongoing research, publish their own research, or present their research at a national medical conference.

As part of the research process, the rotation includes ethics-focused lectures on topics such as:

- PRISM
- HIPPA
- Human research subjects

“This clinical research experience was very inspiring, and I must say that I learned a lot from Dr. L. Although very busy, Dr. L would spend time during meetings and out of meeting hours to respond to all questions I had and was very encouraging throughout the entire research experience. I highly recommend the clinical research rotation with Dr. L to medical students or graduates who are interested in surgery as it offers a great opportunity to learn a lot about the surgical field.”
